FIELD INSTALLATION OF MAGNETIC CATCH

The magnetic catch is designed to be used in most of JL’s steel cabinets. A single magnet is added to the inside of the door and will be magnetically attracted to the steel door stop.

1. Replacement of existing roller catch: Remove roller catch hardware.
2. Make a mark 3.75" above the center line of the door. (pre-drilled holes are centered top to bottom on the cabinet “A”).
3. Remove release liner from the back of the magnet and press into place centered top to bottom on the mark “B”. Make sure the magnet does not protrude beyond the edge of the door, yet is very close to the door edge so that it aligns with the door stop when closed.
4. Close door.
5. Adhesive sets up in about 24 hours, so avoid opening and closing if possible.
